

ASHRAE Guidelines for Healthcare

Leadership in Filtration

**MANN +
HUMMEL**

Eliminating the Danger of Filter Bypass

Standards for minimal filter efficiency requirements, like ASHRAE 170, are very useful but there are many factors that can affect the actual performance realized from a filtration system in a ‘real world’ application.

To this end, there is additional guidance provided by ASHRAE as to the importance of proper installation/maintenance of the filters as well as the filter frame/housing:

At the design phase, filters and air cleaners are generally assumed to be installed and operating correctly. In actual installations, there could be air and contaminant bypass around air cleaning devices (Ward and Siegel 2005), degradation in the performance of some technologies over time (Lehtimäki et al. 2002), and potential for the emission of primary and/or secondary by-products (Zhao et al. 2007; Rim et al. 2013).

ASHRAE Position Document on Filtration and Air Cleaning 2015

So using a filter that meets minimal standards is just the first step in ensuring the filtration system is meeting the performance criteria. The bypass of unfiltered air around an improperly installed or gasketed filter as well as around a poorly installed or maintained filter frame/housing can have dramatic effects on the air cleanliness. Studies have documented a significant decrease in filter removal efficiency when bypass is present. High efficiency filters suffered the most dramatic efficiency loss – a MERV 15 filter decreased to a MERV 8 level. Lower efficiency filters were also affected, a MERV 6 filter decreased to <MERV 5 levels (Modeling Filter Bypass: Impact on Filter Efficiency by Jeffery Siegel and Matthew Ward).

The impact of the bypass of unfiltered air as well as the impact of unexpected environmental issues or even the degradation of performance all lend themselves to the continual monitoring of the filtration systems. Advancements in technology make this available and practical today.

It is no longer simply good enough to use an equivalent product or service. MANN+HUMMEL's products and services provide real solutions to your filtration issues in the healthcare industry and prepare you for tomorrow's demands.

Design Parameters Inpatient Spaces

Function of space	Pressure relationship to adjacent areas	Minimum outdoor ACH	Minimum total ACH	All room air exhausted directly to outdoors	Minimum filtration efficiencies	Design relative humidity [%]	Design temperature [°F]
NURSING UNITS AND OTHER PATIENT CARE AREAS							
All anteroom	e	NR	10	Yes	MERV 8	NR	NR
All room	Negative	2	12	Yes	MERV 14	Max. 60	70 - 75
Cesarean Delivery room	Positive	4	20	NR	MERV 16	20 - 60	68 - 75
Combination All/PE anteroom	e	NR	10	Yes	HEPA	NR	NR
Combination All/PE room	Positive	2	12	Yes	HEPA	Max. 60	70 - 75
Continued care nursery	NR	2	6	NR	MERV 14	30 - 60	72 - 78
Critical care patient care station	NR	2	6	NR	MERV 14	30 - 60	70 - 75
Emergency dept. exam/treatment room	NR	2	6	NR	MERV 14	Max. 60	70 - 75
Emergency dept. human decontamination	Negative	2	12	Yes	MERV 14	NR	NR
Emergency dept. public waiting area	Negative	2	12	Yes	MERV 8	Max. 65	70 - 75
Emergency dept. trauma/resuscitation room	Positive	3	15	NR	MERV 14	20 - 60	70 - 75
Emergency service triage area	Negative	2	12	Yes	MERV 8	Max. 60	70 - 75
Intermediate care patient room	NR	2	6	NR	MERV 14	Max. 60	70 - 75
Labor/delivery/recovery	NR	2	6	NR	MERV 14	Max. 60	70 - 75
Labor/delivery/recovery/postpartum	NR	2	6	NR	MERV 14	Max. 60	70 - 75
Laser eye room	Positive	3	15	NR	MERV 14	20 - 60	70 - 75
Neonatal intensive care	Positive	2	6	NR	MERV 14	30 - 60	72 - 78
Newborn nursery	NR	2	6	NR	MERV 14	30 - 60	72 - 78
Nourishment area or room	NR	NR	2	NR	MERV 8	NR	NR
Nursery workroom	NR	2	6	NR	MERV 8	Max. 60	72 - 78
Operating room	Positive	4	20	NR	MERV 16	20 - 60	68 - 75
Operating/surgical cystoscopic rooms	Positive	4	20	NR	MERV 16	20 - 60	68 - 75
Patient care area corridor	NR	NR	2	NR	MERV 14	NR	NR
Patient room	NR	2	4	NR	MERV 14	Max. 60	70 - 75
Patient toilet room	Negative	NR	10	Yes	MERV 8	NR	NR
PE anteroom	e	NR	10	NR	HEPA	NR	NR

NR = not required. e = see Section 7.2.1 of the ASHRAE document.

Air Filtration Requirements for Compounding Pharmacies

The United States Pharmacopeia (USP) is an independent scientific nonprofit organization that has as their main focus to ensure safe and reliable medicine, dietary supplements and foods.

USP 797/800 OVERVIEW:

USP 797 - ENSURES THE STERILITY OF COMPOUNDED STERILE PREPARATIONS TO PROVIDE SAFE MEDICINE.

- The compounding environment is critical to providing a sterile preparation. USP 797 requires a dedicated space designed to minimize the risk of contamination, this Cleanroom suite includes a Cleanroom including buffer and ante areas. This Cleanroom is constructed and maintained to meet rigorous purity standards.

USP 800 - COVERS THE HANDLING OF HAZARDOUS DRUGS THAT PROTECTS PATIENTS, WORKERS AND ENVIRONMENT.

- UPS 800 has requirements for containment engineering controls like local containment devices, ventilation systems and air pressure differential to minimize the release of hazardous particles. These controls help prevent cross-contamination, safeguard staff and patients, and maintain the integrity of the cleanroom environment.

Both standards emphasize the importance of maintaining a sterile and controlled environment for compounding sterile preparations and handling hazardous drugs. They share focus on personnel training, PPE, and environmental controls, this includes factors such as proper ventilation, air filtration, and environmental monitoring.

MANN+HUMMEL has over 1,000 engineers working endlessly on research & development to equip the healthcare industry & prepare for the future.
